SECTION 3. Phase II Bond Release Supporting Information

Historical Revegetation and Vegetation Sampling

INTRODUCTION

The Phase II Bond Release information in this section includes historical revegetation information and results and analysis of vegetation sampling in support of the application. The Phase I bond release for the Reclaimed Liability Release Areas (RLRAs) included in this application for the N11 Coal Resource Area (CRA) was approved in September 2019. The Phase I bond release for the RLRAs included in the application for the J19 CRA was submitted in June 2020; the application is still pending.

HISTORICAL REVEGETATION

Revegetation activities for J19 and N11 RLRAs included in this application were conducted during the years 1999 through 2019. Details of revegetation procedures and applied seed mixes for initial seeding and reseeding have been previously reported to the regulatory authority in annual monitoring reports. This information and supporting maps are contained in the Minesoil Reconstruction and Revegetation Activities – Report, Black Mesa and Kayenta Mines for the years 1996 through 1999 as well as in Tab 2 of the Reclamation Status and Monitoring Report, Black Mesa and Kayenta Mines for the years 2000 through 2021. Revegetation procedures are summarized as follows. Upon completion of soil replacement, sites were deep ripped and then contour furrow disked to aid in surface stabilization and prepare the seedbed. The sites were then seeded during the next available seeding season using the approved permanent seed mix and seeding practices. Following seeding the sites were mulched with native grass hay at two tons per acre and then crimped to anchor the mulch. Maps 3.1.1 and 3.1.2 shows the permanent program revegetation areas by year of seeding included in this Phase II application.

PHASE II VEGETATION SAMPLING

The sampling methods and results presented in the application address the requirements for Phase II bond release. Sampling methods are consistent with approved vegetation baseline and monitoring study methods for the Kayenta Mine as outlined in the AZ-0001F Permit Application Package (PAP), Chapter 9, Attachment 2. These methods have been used for all sampling at Kayenta Mine.

The Guideline to Bond Release Procedures for Permanent Programs Lands, Indian Programs Branch, Western Region, OSMRE (2017) states that the operator must demonstrate for Phase II bond release that “the reclaimed plant community is successfully established in accordance with 30 CFR 816.111 and the approved PAP.” 30 CFR 816.111 states that the vegetative cover must be:

1. Diverse, effective, and permanent;
2. Comprised of species native to the area, or of introduced species where desirable and necessary to achieve the approved postmining land use and approved by the regulatory authority;
3. At least equal in extent of cover to the natural vegetation of the area; and
4. Capable of stabilizing the soil surface from erosion.

This section includes the discussion of the first three requirements. Section 4 of this application includes the discussion of sediment loss and erosion.

Phase II bond release requires statistically valid methods and random sampling of reclaimed and reference areas and comparison of the sampling results for these two areas. For purposes of permanent program vegetative cover evaluations, the J7, N7/8, and N14 sagebrush reference areas (SBRAs) determine the

cover success standard. A minimum of 20 samples were collected in the RLAs and 15 samples in the SBRAs. Sample adequacy was calculated from first-hit foliar vegetation cover sample values using the following formula:

$$N_{min} = \frac{t^2 * s^2}{d^2 * \bar{x}^2}$$

where:

N_{min} = minimum number of samples required

t = one-tailed t-value with n-1 degrees of freedom

s^2 = sample variance (n-1 degrees of freedom)

d = 0.1 (level of precision or desired detectable reduction)

\bar{x} = sample mean

The vegetation sampling locations are shown on Maps 3.2.1 and 3.2.2 (RLAs) and 3.2.3 (SBRAs). The vegetation data included in this application were collected in fall 2020 and fall 2021 in the RLAs and SBRAs. Vegetation cover data from both sampling events in the RLAs and SBRAs were subjected to hypothesis testing as described in the AZ-0001F PAP. Total first-hit live foliar vegetation data minus noxious weeds (Arizona or Navajo Nation A- or B-listed) were used for this evaluation.

VEGETATION DATA SUMMARY

Data summaries for the vegetation monitoring studies supporting this liability release application are presented in this section and summarized in Table 3.1. Noxious weeds (Arizona or Navajo Nation A- or B-listed) were removed from vegetation cover summary data, but not removed from ground cover data used for sediment loss and erosion evaluations discussed in Section 4 of this application. Raw data for all datasets are presented in Appendices 3.1 (2020 and 2021 RLAs and 3.2 (2020 and 2021 SBRAs). The data in each of these appendices is organized by area and year.

Table 3.1: Summary Statistics for the J19 and N11 RLAs and J7, N7/8, and N14 SBRAs

Site ID	Sample Period	Foliar Vegetation Cover*	Ground Cover**	Grass Cover	Shrub/Subshrub Cover	Forb Cover	Total Species Present

* A- and B-list noxious weed (Arizona or the Navajo Nation) were removed from foliar vegetation totals.

** Ground cover includes all vegetation, standing dead, litter, and rock cover.

Sample Adequacy

A summary of sample adequacy calculations for total vegetation cover in the J19 and N11 RLAs as well as the J7, N7/8, and N14 SBAs is presented in Table 3.2. Adequate samples were obtained in all sample areas during each sampling period within the years sampled.

Table 3.2: Sample Adequacy Calculations for the J19 and N11 RLAs and J7, N7/8, and N14 SBAs

	2021	27.5	4.2	1.345	15	5

SBRA Cover

Total foliar vegetation cover ranged from 11.0 percent in the J7 SBRA in 2021 to 32.1 percent in the N14 SBRA in 2020 (Table 3.1). Average foliar cover for all three SBAs was 22.4 percent in 2020 and 19.4 percent in 2021. Total ground cover (including live vegetation, standing dead, litter, and rock cover) ranged from a low of 52.7 percent in 2021 in the J7 SBRA to a high of 66.0 percent in the N7/8 SBRA in 2021. Average ground cover for all three SBAs was consistent with 59.9 percent in 2020 and 58.9 percent in 2021.

Litter cover was the greatest component of the ground cover after live vegetation but was variable between the three SBAs. Litter cover ranged from 11.3 percent in the N14 SBRA in 2020 to 25.8 percent in the J7 SBRA in 2021 (Appendix 3.2). Litter cover averaged 20.8 percent over the six SBRA sampling events.

Rock cover was consistently greatest in the N7/8 SBRA ranging from 12.9 percent in 2020 to 18.4 percent in fall 2021. The other SBAs had little or no rock. Values for rock cover averaged 0.1 percent in the N14 SBRA and 2.9 percent in the J7 SBRA.

Shrubs and subshrubs comprised the largest component of the vegetation cover in all six sampling events with an average of 57 percent of the vegetation cover across all datasets. The most common shrub species in all three SBAs was big sagebrush (*Artemesia tridentata*) with a significant contribution from fourwing saltbush (*Atriplex canescens*) and Greene's rabbitbrush (*Chrysothamnus greenei*) in the J7 and N7/8 SBAs. Native perennial grasses were the second largest component in reference areas. Native perennial grasses comprised 30 percent of the vegetation cover on average. Blue grama (*Bouteloua gracilis*) was the most commonly encountered grass species in all three SBAs.

RLRA Cover

J19 RLRA Cover

Total foliar cover was 26.0 percent in 2020 and 26.6 percent in 2021 (Table 3.1 and Appendix 3.1). Total ground cover was 61.3 percent in 2020 and 59.5 percent in 2021. Litter cover was the greatest component of the ground cover after live vegetation and ranged from 33.7 percent in 2020 to 24.4 percent in 2021. Rock cover ranged from 1.2 to 3.8 percent.

Forbs comprised 52 percent and 61 percent of the total vegetation cover in 2020 and 2021, respectively. The dominant species were the annual introduced species kochia (*Kochia scoparia*) and Russian thistle (*Salsola iberica*). While these species are not necessarily desirable, they are common early colonizers that can provide a mulch and nurse effect for the developing perennial species in the community. As the reclamation community develops, these species tend to drop out and are typically minimal after three to five years.

Total grass cover was 9.9 percent in 2020 and 6.2 percent in 2021 (Table 3.1) and comprised 38 percent and 23 percent of the total vegetation cover each year, respectively. The dominant grass species was Russian wildrye (*Elymus junceus*), contributing between 5 and 13 percent of the total vegetation cover each year. Shrubs and subshrubs, primarily fourwing saltbush were the other important species contributing between 9 percent and 16 percent of the total vegetation cover in 2020 and 2021, respectively.

N11 RLRA Cover

Total foliar cover was 20.0 percent in 2020 and 17.5 percent in 2021 (Table 3.1 and Appendix 3.1). Total ground cover was 55.9 percent in 2020 and 54.5 percent in 2021. Litter cover was 23.6 percent in 2020 and 17.6 percent in 2021. Rock cover was 5.8 percent in 2020 and 17.0 percent in 2021.

The grass component comprised most of the total vegetation cover in both years. Total grass cover was 12.9 percent in 2020 and 7.6 percent in 2021 (Table 3.1) and comprised 65 percent and 43 percent of the total vegetation cover, respectively. The dominant species, Russian wildrye, contributed 37 percent and 23 percent of the total vegetation cover in 2020 and 2021, respectively. Native cool season perennial wheatgrasses (*Agropyron spp.*) also contributed substantially. Shrubs and subshrubs, primarily fourwing saltbush, contributed 21 percent of the total vegetation cover each year. Forbs, primarily kochia and Russian thistle, contributed 15 percent and 35 percent of the total vegetation cover in 2020 and 2021, respectively.

Species Diversity

Species diversity is measured by recording all species occurring within one meter on either side of each vegetation cover transect. The total number of non-noxious species observed along all RLRA transects was lowest in the 2020 sampling of the J19 RLRA with only 27 species and highest in the J19 RLRA in 2021 with 57 species observed. The J19 RLRA averaged 42 species across the two sampling events and the N11 RLRA averaged 46 species across the two sampling events. In the SBRA, the lowest species diversity was found in the N14 SBRA which ranged from 16 to 24 species across the two sampling events and the highest diversity was in the N7/8 SBRA which ranged from 35 to 37 species across the two sampling events. The J7 SBRA ranged from 21 to 24 species across the two sampling events.

RLRA REVEGETATION SUCCESS CHARACTERIZATION

The data collected in the J19 and N11 RLRA demonstrates that they have developed vegetation cover that meets the requirements for Phase II bond release. An effective, diverse, and permanent vegetative cover has been established that is consistent with the post-mining land use. The vegetation cover on the RLRA is comparable to that observed on the SBRA and it is anticipated that these RLRA are on their way to achieving the goals of final bond release when they reach that stage of maturity.

Vegetation Cover

Total vegetation cover in the J19 RLRA was greater than that observed in the J7 and N7/8 SBRA and less than that observed in the N14 SBRA in both years (Figure 3.1). Total vegetation cover in the N11 RLRA was greater than the N7/8 SBRA in 2020 and the J7 SBRA in 2021 (Figure 3.1). It was comparable to the J7 SBRA in 2020 and the N7/8 SBRA in 2021 and less than that observed in the N14 SBRA in both years. Total vegetation cover from all four RLRA datasets was greater than 90% of the average SBRA when subjected to hypothesis testing per the AZ-0001F PAP Table 3.3.

Figure 3.1: Total Foliar Vegetation Cover (Mean + Standard Error) in the RLRA and SBRA

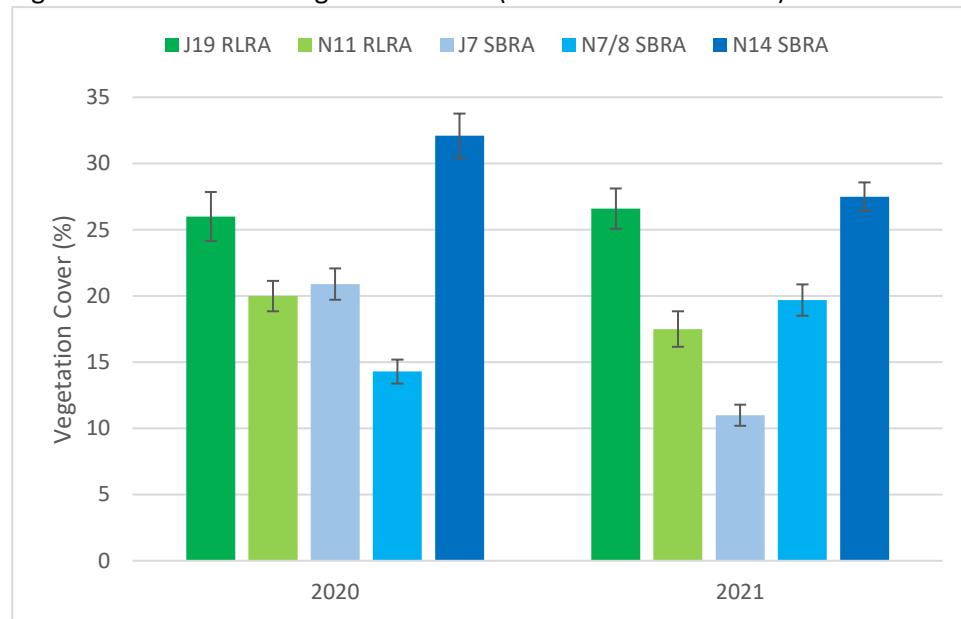

Table 3.1: Hypothesis Testing Results for J19 and N11 RLRA

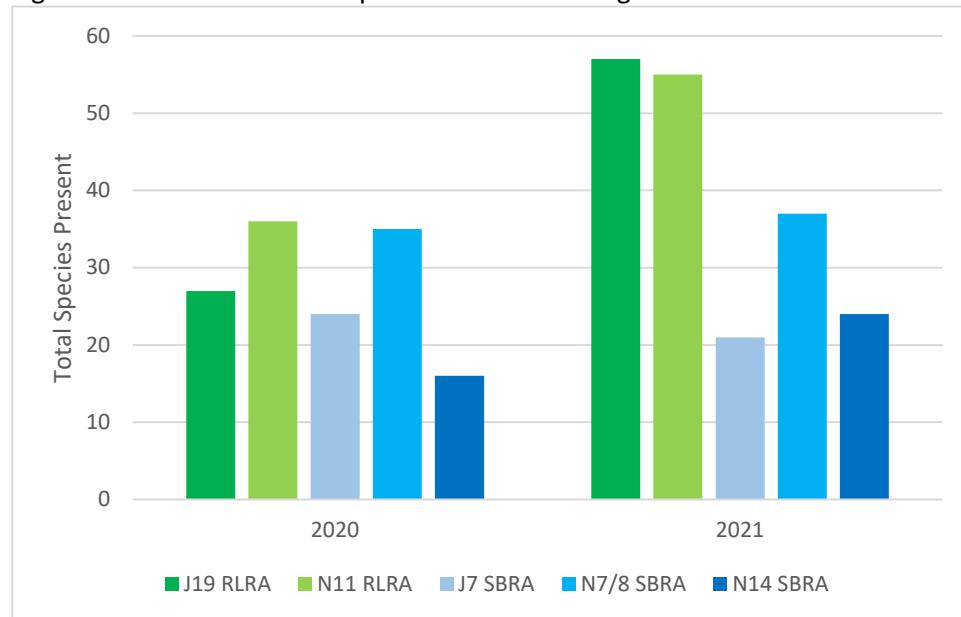

Site ID	Sample Period	90%		t-statistic	t-test value	Reclamation Pass?
		RLRA Mean	SBRA Mean			
J19 RLRA	2020	26.0	20.2	-1.294	3.58	Yes
	2021	26.6	17.5	-1.292	5.98	Yes
N11 RLRA	2020	20.0	20.2	-1.295	-0.10	Yes
	2021	17.5	17.5	-1.294	0.03	Yes

Species Diversity

The total species diversity in both RLRA was greater than the J7 and N14 SBRA in every sampling event (Figure 3.3). The N11 RLRA was also greater than the N 7/8 SBRA in both years and the J19 RLRA was greater than the N 7/8 SBRA in 2021. As with the vegetation cover data, the species composition of the

RLRAs included more grasses and the SBRA included more woody species. Given that these RLRAs are only at the Phase II stage of bond release, there is ample evidence to suggest that the RLRAs will meet Phase III standards in the future.

Figure 3.2: Total Number of Species Observed Along Transects

Utility for Post-Mining Land Use

Much of the vegetation cover observed in the J19 and N11 RLRAs reflects approved seed mixes (36 percent on average of the relative cover in J19 and 70 percent in N11). Seed mixes were formulated to provide good forage production and nutrient levels and palatability for all classes of livestock and a variety of wildlife. While no production data were collected as a part of Phase II sampling, an average of 64 percent of the relative vegetation cover across both RLRAs was species known to have high palatability for livestock, with another 11 percent of the cover made up of species with medium forage palatability.

Russian wildrye was a primary species throughout all three RLRAs contributing an average of 19 percent of the relative cover. This species has a very long season of use and high digestibility through much of the year. It retains good nutrient qualities as standing hay in the winter. Russian wildrye also exhibits good regrowth and recovery after grazing and when spring moisture and summer rains are likely. These qualities make this grass a valuable species throughout the year and compliment the other reclamation species in the PWCC grazing management program.
